

Basic Flow Control: The Weather Adviser Program

Overview

In this assignment, you will create a simple Python program called "The Weather Adviser." This program will ask the user about the current weather and provide recommendations based on their input. The purpose of this assignment is to practice basic flow control in Python, including the use of `if`, `elif`, and `else` statements, as well as user input handling. To get started, ensure that you download the "assignment.py" template file attached to this assignment in Blackboard. Use the "Load" button in Mu to load the attached template file and start your work.

Objectives

- Understand and implement basic flow control with conditional statements.
- Handle user input and provide appropriate output based on that input.

Requirements

User Input

The program should begin by asking the user about the current weather. This should include questions about temperature (hot, mild, or cold) and weather conditions (sunny, rainy, or snowy).

Weather Recommendations

Based on the user's input, the program should print recommendations.

Use of Conditional Statements

Employ `if`, `elif`, and `else` statements to handle the different combinations of weather conditions.

Temperature	Weather Condition	Response
hot	sunny	Wear sunscreen and drink plenty of water.
hot	rainy	Wear light clothing and carry an umbrella.
hot	snowy	This is an unusual combination! Stay indoors if possible.
mild	sunny	Enjoy the pleasant weather, maybe with a light jacket.
mild	rainy	Carry an umbrella and wear a waterproof jacket.
mild	snowy	Dress in layers and be prepared for cooler temperatures.
cold	sunny	Wear a warm coat but enjoy the sunshine.
cold	rainy	Wear a warm waterproof jacket and carry an umbrella.
cold	snowy	Wear a warm coat, gloves, and a hat.
All other cases		Please try again. You have provided an invalid option.
