

Python Basics: Hello World!

Overview

In this assignment, you will write a python program that prints Hello World! to the terminal. The main purpose of this assignment is to write your first python program and ensure your development environment (Mu) is set up correctly.

Objectives

- To ensure you are able to save and upload Python code files to Gradescope.
- To practice writing a simple Python program.

Requirements

- Your program should print the exact output: Hello World!
- If you print anything else, your submission will not receive credit and you will need to re-submit your code.
- Examples of incorrect output:
 - Hello world!
 - hello world!
 - Hello World
 - Hello, world!
 - Etc...
- In programming, you must be very specific with your code. Small errors can lead to huge bugs. These small differences may seem pedantic, but your specificity is very important.
- Save your program using the Save button in Mu and submit your code to Gradescope using the link in this module.
